

Discover-Phish

A unified dashboard that gives security teams full visibility and control over every email—internal and external.

Introduction

Discover-Phish is an advanced Phishing Detection and Response platform that analyzes all internal and external email traffic.

Powered by dPhish's pioneering Enriched Object Detection (EOD) methodology, it transforms every email into an enriched, actionable object, enabling analysts to create complex detection logic, uncover hidden threats, and orchestrate response across the entire security ecosystem.

The Challenge

Phishing is one of the most dominant initial attack vectors in modern cyber incidents. Yet most existing solutions fall short — lacking visibility over internal emails, limiting analyst control, relying on vendor updates, and offering little in the way of enriched context, effective response, or threat hunting capabilities.

dPhish's Approach

Discover-Phish is built on three core pillars:

01. Unified Visibility

Centralized analysis of all internal, external, and reported emails

02. Enriched Object Detection

Enriched email objects enabling advanced, multi-condition detection

03. Integrated Response

Seamless orchestration across security controls to contain threats

★ Feature Matrix

Features	Capabilities
Detection Engines	<ul style="list-style-type: none"> Enriched Object Detection (Logic rules) Advanced AI classification engine YARA signature detection IOC feeds integration
Enriched Object Detection (EOD)	<ul style="list-style-type: none"> Transform email into enriched object Code inspection URL inspection Content inspection Screenshots & OCR
Multi-Channel Coverage	<ul style="list-style-type: none"> External emails Reported emails Internal emails Unified dashboard
Scoping	<ul style="list-style-type: none"> 1-click scoping (graph view) Advanced threat hunting Campaign relationship mapping Advanced query language
Response Fabric	<ul style="list-style-type: none"> Email server integration Orchestrated response actions & playbox Web proxy integration Attack recurrence prevention DNS security integration Email gateway integration
Alert Management	<ul style="list-style-type: none"> MTTD & MTTR tracking Alerts-based breakdown Alert status workflow Risk score dashboard
Integrations	<ul style="list-style-type: none"> SIEM integration Web Proxy REST API (SOAR) Email Gateway LDAP / Active Directory DNS Security Single Sign On (SSO)

🔍 Why Discover?

Discover is a new level of **anti-phishing** that provides a full set of new and required features

01. Not limited to gateway-level detection.

03. Full visibility across internal, external, and reported emails.

02. Analyst-driven advanced multi-condition detection logic (no vendor dependency).

04. Detection + Response + Hunting in one platform.

Key Values

01. AI-Powered Threat Detection

- **A robust**, multilingual AI engine trained on large-scale email threat datasets to identify sophisticated phishing and emerging threats.

03. Response Fabric

- **Seamlessly integrates existing security solutions**, including email servers, web proxies, DNS security, and email gateways, to orchestrate response actions and prevent attack recurrence across multiple vectors.

05. High Detection Efficiency

- **Powered by an advanced AI engine**, an enriched object detection methodology, and extensive threat signatures to ensure high detection accuracy.

07. Enriched Object Detection

- Pioneering dPhish methodology where each email is transformed into an enriched object containing deep contextual data, such as attachment content (including embedded scripts), analysis of files within compressed archives, and URL intelligence (code inspection, screenshots, OCR, and more). This enables analysts to easily search, correlate, and build advanced detection use cases across all email components.

02. Multi-Channel

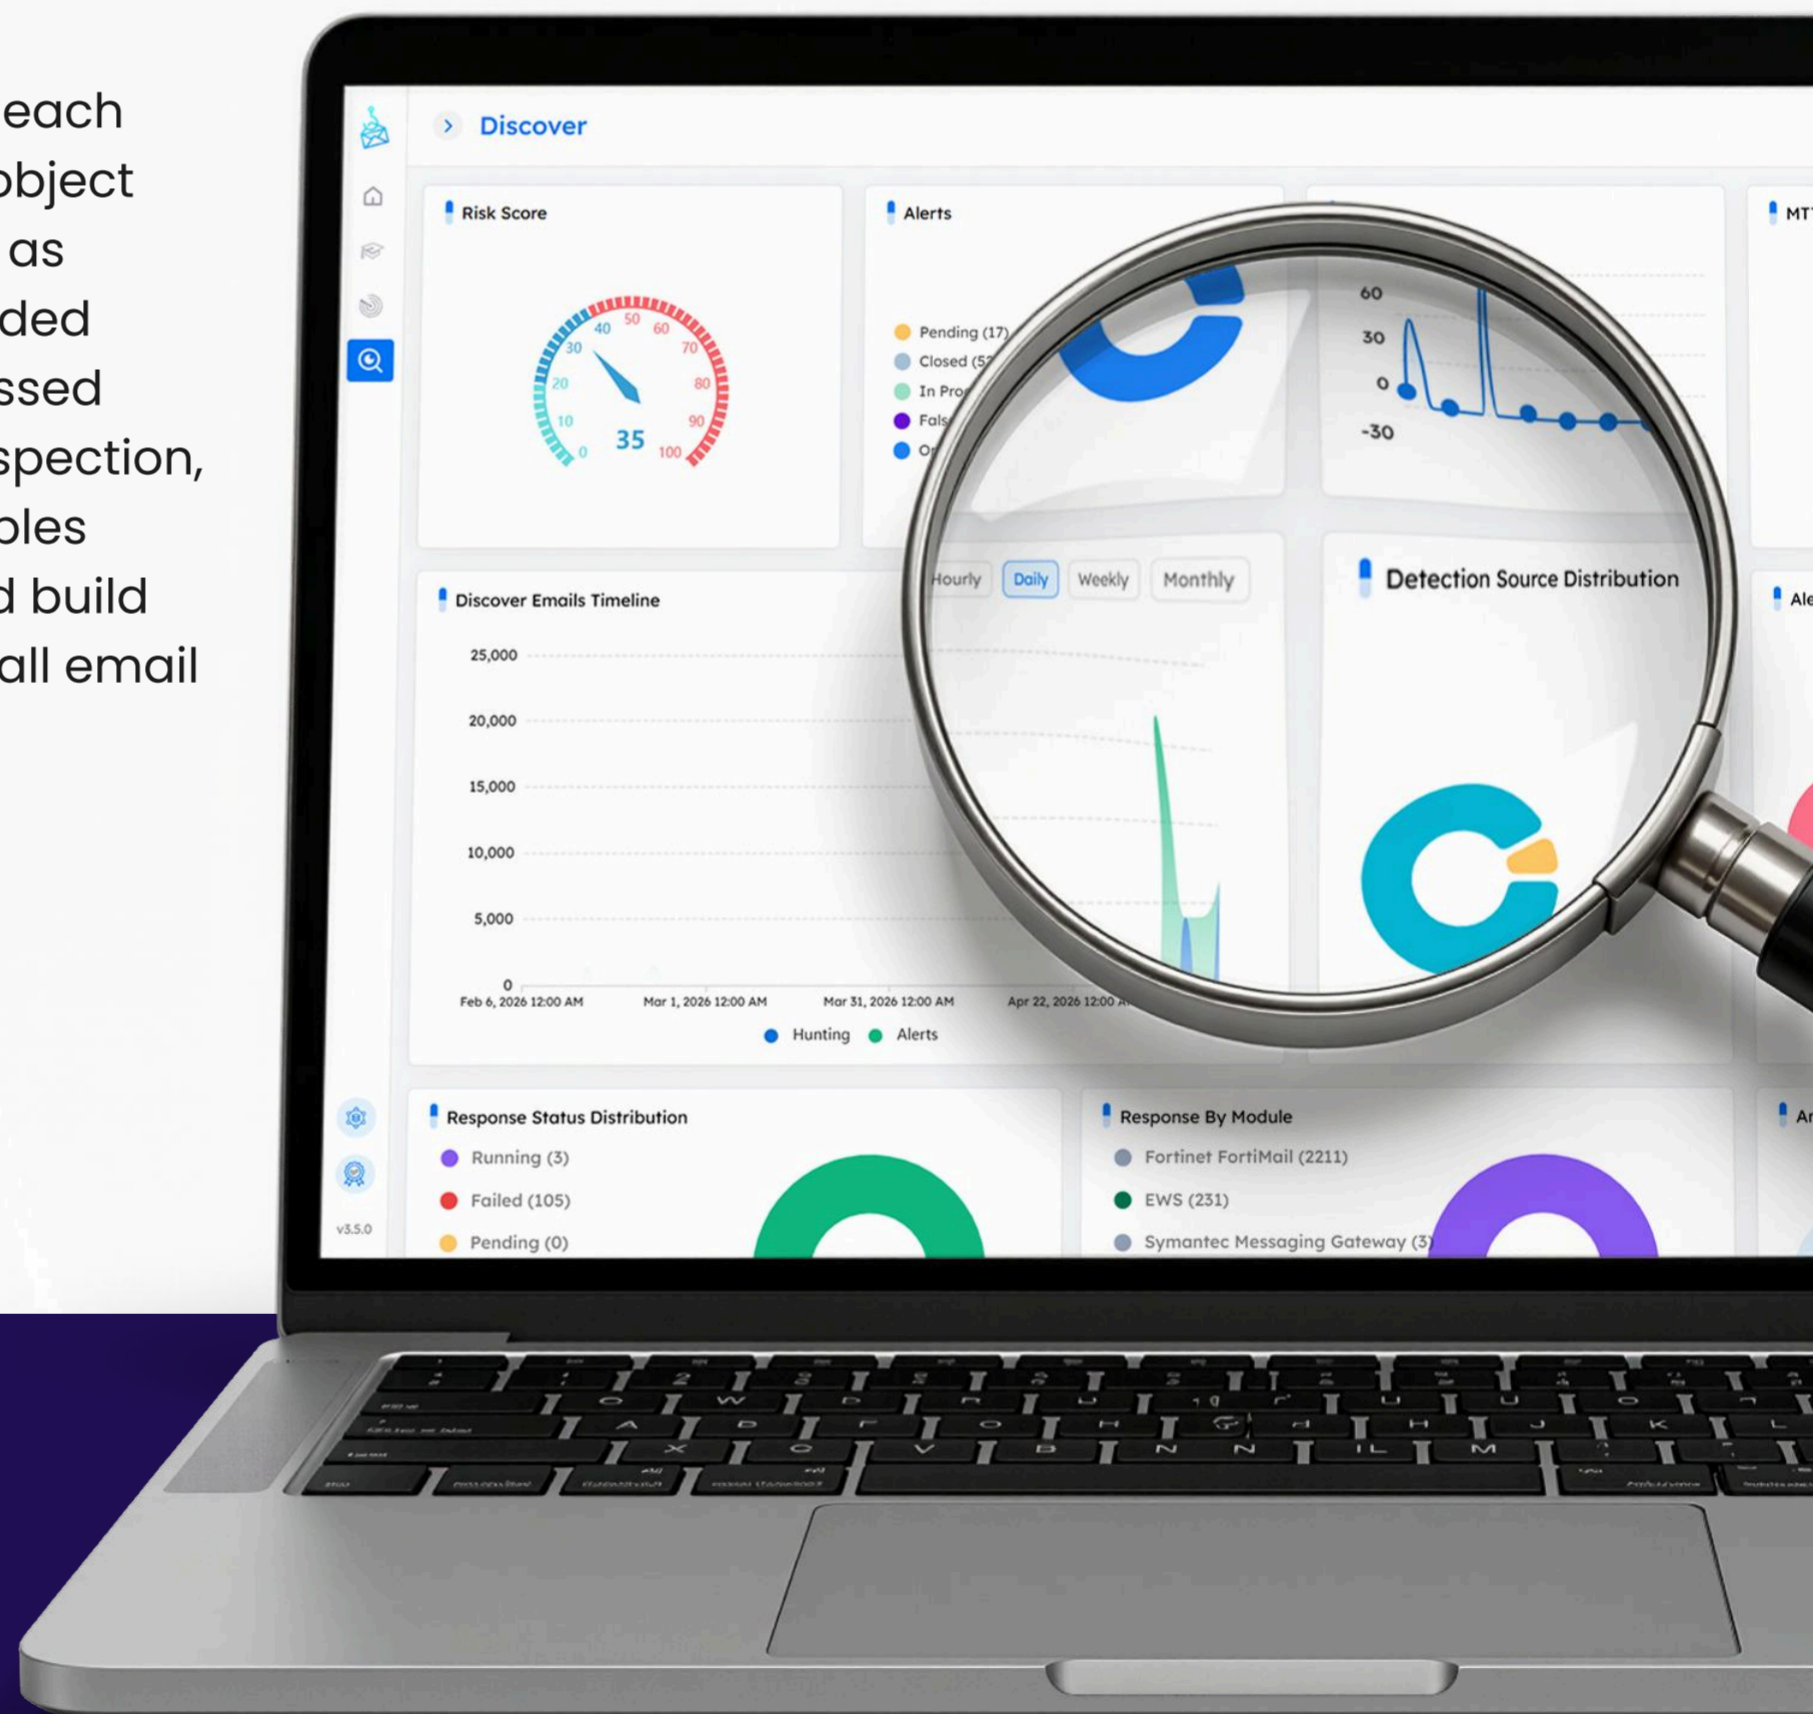

- **All internal**, external, and reported emails are centralized and categorized within a single unified dashboard.

04. Advanced Query Language

- **Discover-Phish** provides a powerful query language over enriched objects, supporting complex searches, correlations, and aggregations for advanced threat analysis.

06. 1-Click Scoping (Graph View)

- **With a single click**, analysts can scope attacks and identify related campaigns by leveraging similarities and relationships across analyzed emails.
